

# mesuNET

**Network software and hardware  
for metal detectors and X-ray systems**

## Safe and process-reliable

The mesuNET software offers a clear, modern user interface for the maintenance and process data visualisation of metal detectors and X-ray inspection systems. Data from systems are collected in real time and prepared for the user. As part of maintenance work, our service team can be granted direct access to the connected systems via VPN.

## Compliant with design and data management

Access is user-based and password-protected. This rules out the possibility of manipulation. The system offers extensive possibilities for the manual or automatic creation of reports on batches, products, after events, and much more.

## Flexible adaptation to the application

The user interface can be accessed via any network computer via a standard web browser. Devices from the AMD 05, AMD 07 and easySCOPE series can be integrated into the network. For AMD 05 systems, this is done via can BUS and, if necessary, Ethernet adapters. AMD 07 and easySCOPE are directly connected via Ethernet TCP/IP. The software is hosted on the high-quality Multilink Master Server, which is part of the overall package, as standard. Other solutions are possible in consultation with our application department.
