

Inspection systems

for the production of granular foodstuffs

Reliable, precise and user-friendly

X-ray inspection systems, metal detectors and separators from Mesutronic

Why detect foreign bodies?

Despite all safety precautions, the contamination of bulk materials with foreign substances is unfortunately a problem in every manufacturing company. The effects are often dramatic if these are not reliably detected and removed from the production chain. Damage to processing machines, problems during audits, loss of supplier contracts and, in the worst case, severe image problems among consumers are often the result of inadequate control systems. In addition, X-ray inspection systems offer a wide range of other possibilities for checking the quality of granular products in the food sector.

Why Mesutronic?

For more than 30 years, we have been developing inspection systems with and for companies in granular foodstuffs. These are used for inspecting instant products, salt, sugar, flours, basic substances and additives, as well as many other powders and granulates. For all those who need foreign body detection for their production facilities and value "Quality – made in Germany", Mesutronic is your experienced, solution-oriented, internationally active specialist and loyal partner.

We achieve this because everything from development to design and installation, up to service and maintenance is consistently geared towards individual industry and customer needs.

» Machine protection and quality assurance
- reliable and user-friendly.

Manufactured in Bavaria, used throughout
the world. «

Christian Boxleitner
Managing Director

Incoming goods area

In the incoming goods area, metal detectors and metal separators are used for the initial check.

These can be installed in the pneumatic conveying line for the emptying of lorries, big bags in free fall, or on a conveyor belt. They can be used for examining grains, seeds, minerals, vegetables and other source materials. This allows contaminants to be traced back directly to the supplier.

Type **P-TRON 05 GM** separators are available in nominal diameters of up to 200 mm. This makes them ideal for use in silo feeders or for the main distribution system after the silo. They can be used for both the pressure and vacuum conveying of powders or granulates. Contaminated material is discharged through lock valves without loss of pressure. The detection units used are optimally shielded against environmental disturbances and are also very easy to integrate into existing pipeline systems.

QUICKTRON 07 RH free-fall separators can be used after silos or when emptying big bags. They reliably protect mills and other crushing systems. A variety of nominal diameters, accessories or special versions such as ATEX-compliant devices are available for every application. Even with larger diameters, they offer good detection accuracy.

Naturally obtained raw materials such as beets, potatoes, rock salt and others carry a high risk of introducing metallic contamination. Metal detectors of the **METRON 07 CI** series are used to close this safety vulnerability in incoming goods.

After this they are easy to integrate into trough conveyor belts so that complaints about contaminated batches of raw materials can be made directly to the supplier and to prevent damage to the first processing machines.

Outgoing goods area

In packaging, the task of quality assurance is of prime importance.

According to the HACCP criteria, a final check for foreign bodies should take place if re-contamination can be excluded. This usually means the inspection of the product when its primary packaging is closed. Inspection in any secondary packaging is also possible. However, here a check must be made of whether the recognition accuracy at this point is still sufficient.

The most common variant of inspection in this area are conveyor belt systems of the **TRANSTRON** type. As a supplement to our metal detectors, they represent optimum recognition accuracy and stability. Separation variants such as pushers, blower nozzles, belt retractions or hinged belts are standard. Special variants such as a roll marker for bagged goods are also available. Durable components, starting with bearings via motors and conveyor belts, ensure continuous, low-maintenance operation. We are also happy to offer you systems specially adapted to your production, e.g., as ascending conveyor belts to be placed after the tubular bag machine, or in special installation positions. Supplementary packages for special trading standards such as BRC, TESCO and others are also available.

The classic final inspection is carried out using a tunnel metal detector of the **METRON 07 CI** type.

Like all other systems in the 07 series, it allows seamless logging, automated test routines and simple reporting via USB, the mesuNET network or via direct log export.

For the inspection of powders prior to their filling in bulk packs, and depending on the handling method, different system variants are used for inspecting powders before filling them into large containers. For example, suitable devices for free-fall applications, for example for filling big bags, are the easy-to-clean metal separators of the **QUICKTRON 07 RH** type.

A variety of nominal diameters, accessories or special versions such as ATEX-compliant devices are available for every application. Even with larger diameters, they offer excellent detection accuracy. These are often combined with the test body feed and mesuINSERT collection stations to facilitate regular tests of detection accuracy.

The **P-TRON 07 GM** separators are available in nominal diameters of up to 200 mm. This makes them ideal for use in silo feeders or for feeds to bagging systems. They can be used for both the pressure and vacuum conveying of powders or granulates. Contaminated material is discharged through lock valves without loss of pressure. The detection units used are optimally shielded against environmental disturbances and are also very easy to integrate into existing pipeline systems.

The inspection of final packaged products with metallised film is also possible, but here we generally recommend the use of an **easySCOPE** X-ray scanner.

X-ray inspection

In the granular product sector in particular, inspection for foreign bodies by means of X-rays offers diverse advantages in addition to the search for metals alone. In addition to the detection of other types of contamination such as glass or stones, quality algorithms make a significant contribution to customer satisfaction. An example of this is the weighing of individual bags in a collective packaging.

For the inspection of products with metallic components, X-ray inspection systems are the only meaningful way to carry out a final, policy-compliant inspection. Metal detectors offer, in the case of products which are easy to test and have no intrinsic conductivity, advantages for the detection of low-density types of metal, such as aluminium. In very rare cases, this is also applicable to magnetic impurities, for example iron or nickel. Here, a combination of the two technologies can be the best solution for maximum protection.

For the examination of medium and large packaged products, such as pouches with protein powder or collection cartons with individual bags, the **easySCOPE** X-ray machine with belt widths of 400 or 600 mm are available. Even for beginners in X-ray technology, the device, with its moderate price, high-quality, and thus low-maintenance, components, as well as its extremely intuitive operation, is their best chance of entry into this type of foreign body control. The system detects metallic and non-metallic impurities such as, for example, glass, stones or plastics, by means of an imaging process – X-ray technology.

The **easySCOPE ST**, on the other hand, is the optimal solution for the inspection of smaller, flat products. Without compromising on X-ray performance, it combines easy cleanability with an extremely compact footprint.

As with all other X-ray inspection systems in our portfolio, the **easySCOPE ST** is also available with fitted separation units, sensor packages to meet trade standards, and designs for hot or dusty environments.

Digital products and services

The successful operation of inspection systems is no longer solely dependent on purchasing of the right product, but also on how well the system is connected to the people and machines in its environment. Mesutronic offers a wide range of support services that increase the integration of our products.

Depending on the type of electronics used, our systems can already provide information as standard via analogue signals, various bus systems or Ethernet. Information is received by either controllers, process control systems or other, higher-level machines along the line. In addition to other protocols, with digital networking the OPC UA protocol is used here for the smooth transmission of operating conditions and production-critical values.

If a networking solution is desired purely at the level of foreign body detectors, here **mesuNET** offers optimal performance for the simple creation of reports, evaluation of statistical data, central backup of the event history and as an intermediary to higher-level databases or control systems. This facilitates the easy collection of important OEE data with secure, web-based access without attachment to a single computer.

The **mesuEXPORT** software feature is another easy, automatic and cost-effective way to back up reports. Here, systems with the AMD 07 electronics series are connected to the customer's network drive via Ethernet. The system can then be configured to store event reports for specific events or at specific times. Data is therefore redundantly backed up and cannot be lost - even if the system is completely destroyed.

mesuREMOTE allows our service specialists from Kirchberg im Wald to access any connected system, often avoiding time-consuming on-site deployment. Communication is secured according to current IT standards, encrypted and takes place solely after approval by the customer at all times.

All of this can additionally be secured on the hardware side via a key switch. This means that any uncoordinated manipulation of systems by Mesutronic or third parties is reliably excluded.

The electronic **autoTEST** tester allows significant reduction in manual test cycles in devices of the 07 electronics series.

Signals from physical test bodies are copied via an interference coil that operates independently of the detector. As a result, short test cycles, and thus maximum process reliability, can be implemented without additional effort.

In order to reduce introduction barriers and ensure smooth, long-term operation, we recommend our **training programmes**. We offer a wide range of solutions, from simple operator training included with commissioning to multi-day events on our premises. As with our physical products, we strive to make training as efficient and economical as possible for our customers while still in the coordination phase. The content is recommended by us and then individually adapted to your needs according to the number of participants, their educational background or previous experience.

We are also happy to offer regular training courses at a reduced rate in connection with **maintenance contracts**. These courses are also designed to be customer-oriented. Frequently selected options include, for example, annual on-site maintenance or reduced prices for spare parts. It is also possible to flexibly add or remove devices from the scope of the contract.

Options for maintenance contracts and training in our systems are usually also available for indirect customers of our local partners or OEMs.

The cornerstone of our **after-sales service** is our motivated, trained and customer-oriented service staff. Our promise of “detecting what matters” includes accessibility without compromise and without additional costs, 24 hours a day, 365 days a year. This is supplemented by our cost-effective board exchange programme with reprocessed electronic components as well as the possibility to repair every system ever sold to the market.

Customer-specific projects

Special challenges may arise in particular when retrofitting inspection systems into an existing production environment. The development of solutions for these tasks is one of the core competencies of Mesutronic GmbH. The ways shown range from simple consultation on the deployment of a standard solution in an unusual way, through smaller and larger modifications, to the complete, customised customer system.

We focus on the permanent, reliable and economically optimal fulfilment of your requirements. This is made possible by our company's competent team of employees, who are trained in all relevant areas from sales to application, mechanical and electronic development, up to production and after-sales. They are supported by modern work equipment and a process world embedded in ISO 9001.

We make projects, which we see as a permanent dialogue, transparent for our customers at all times.

The way we see it, our work is not finished when products are delivered, but when production is again functioning smoothly after conversion.
